

Panic Button Application

Introduction

The Panic Button Application (PBA) is stealth Symbian application designed to monitor for activation keys and triggers discreet SMS on installed mobile.

The PBA system is designed to offer minimum users control of the loaded applications on the Symbian mobile device. The PBA installation package can be configured with the designated recipient, SMS message and activation keys using an external PC based GUI application. The PBA also featured "stealth" mechanism to conceal its installation and visibility of its applications on the installed mobile.

System Overview

Features and Characteristics

In operation, it offers

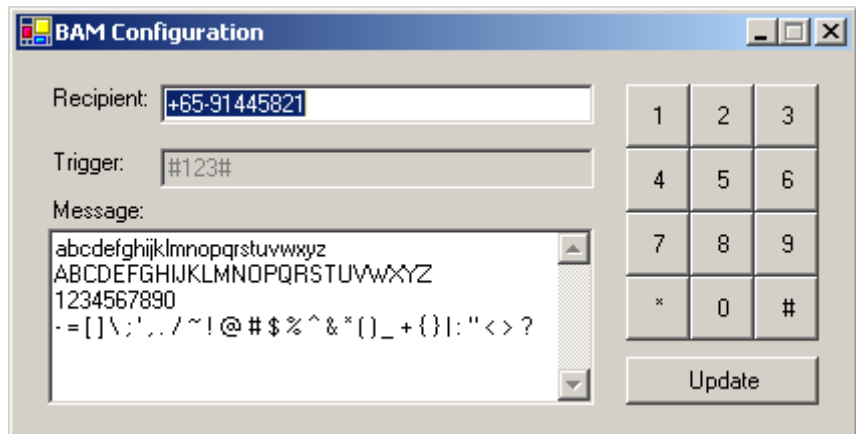

- a discreet mechanism for user to trigger the alert event on his/her mobile phone with predefined key-press sequence.
- checks GSM Network to ensure reliable SMS sending
- cleanup the SMS trails on mobile thereafter
